PlateWise

By: Zachary Evans, Danny Hido, and Jacob Drahuschak

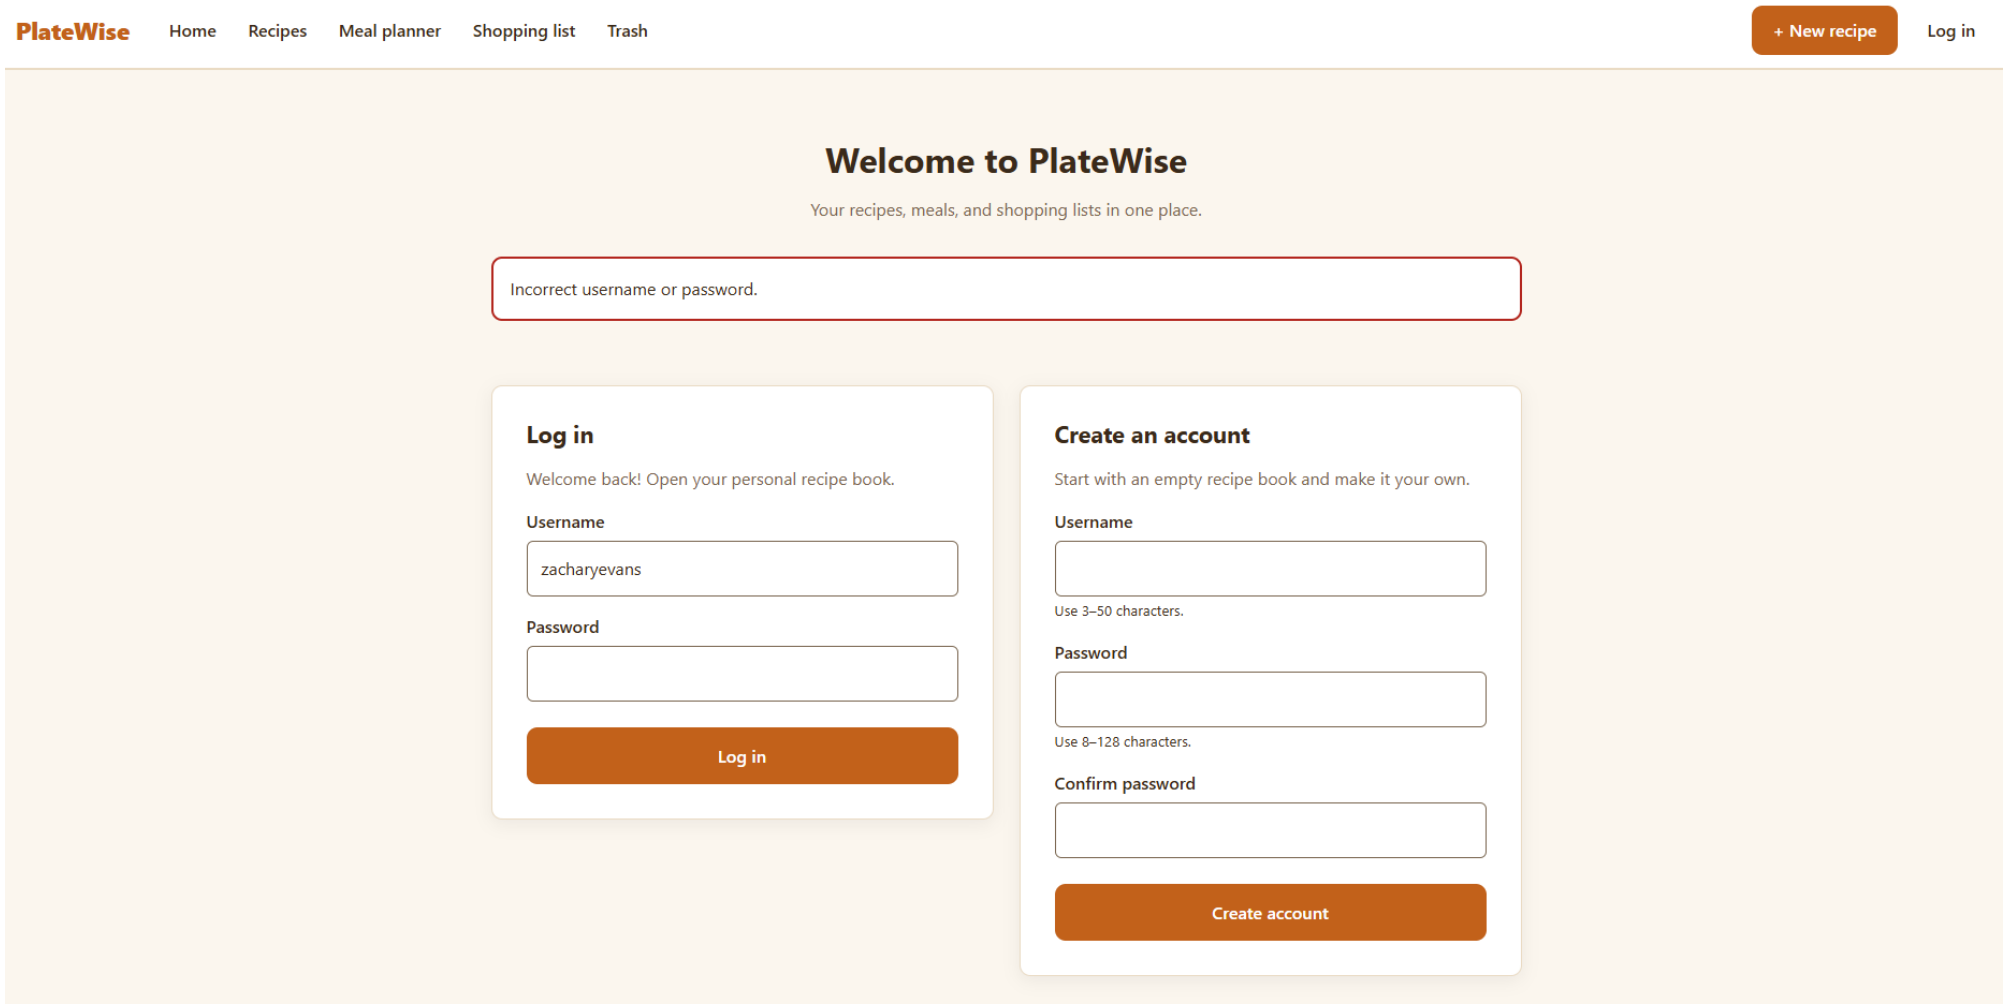

What is PlateWise

What it is – A recipe book / weekly meal planner built with Flask, SQL, JavaScript, CSS, and HTML

Who's it for – PlateWise was designed with college students in mind, who might not have as much experience in the kitchen as others and need an easy-to-use place for storing and organizing their recipes.

What problem does it solve – PlateWise takes your recipe book, weekly meal plan, and grocery list and puts them all in one spot. These three crucial parts of cooking and meal planning are organized in a way that compliments one another. For example, the grocery list is generated each week based off the recipes the user assigned for that week in their weekly meal planner.

Login Screen

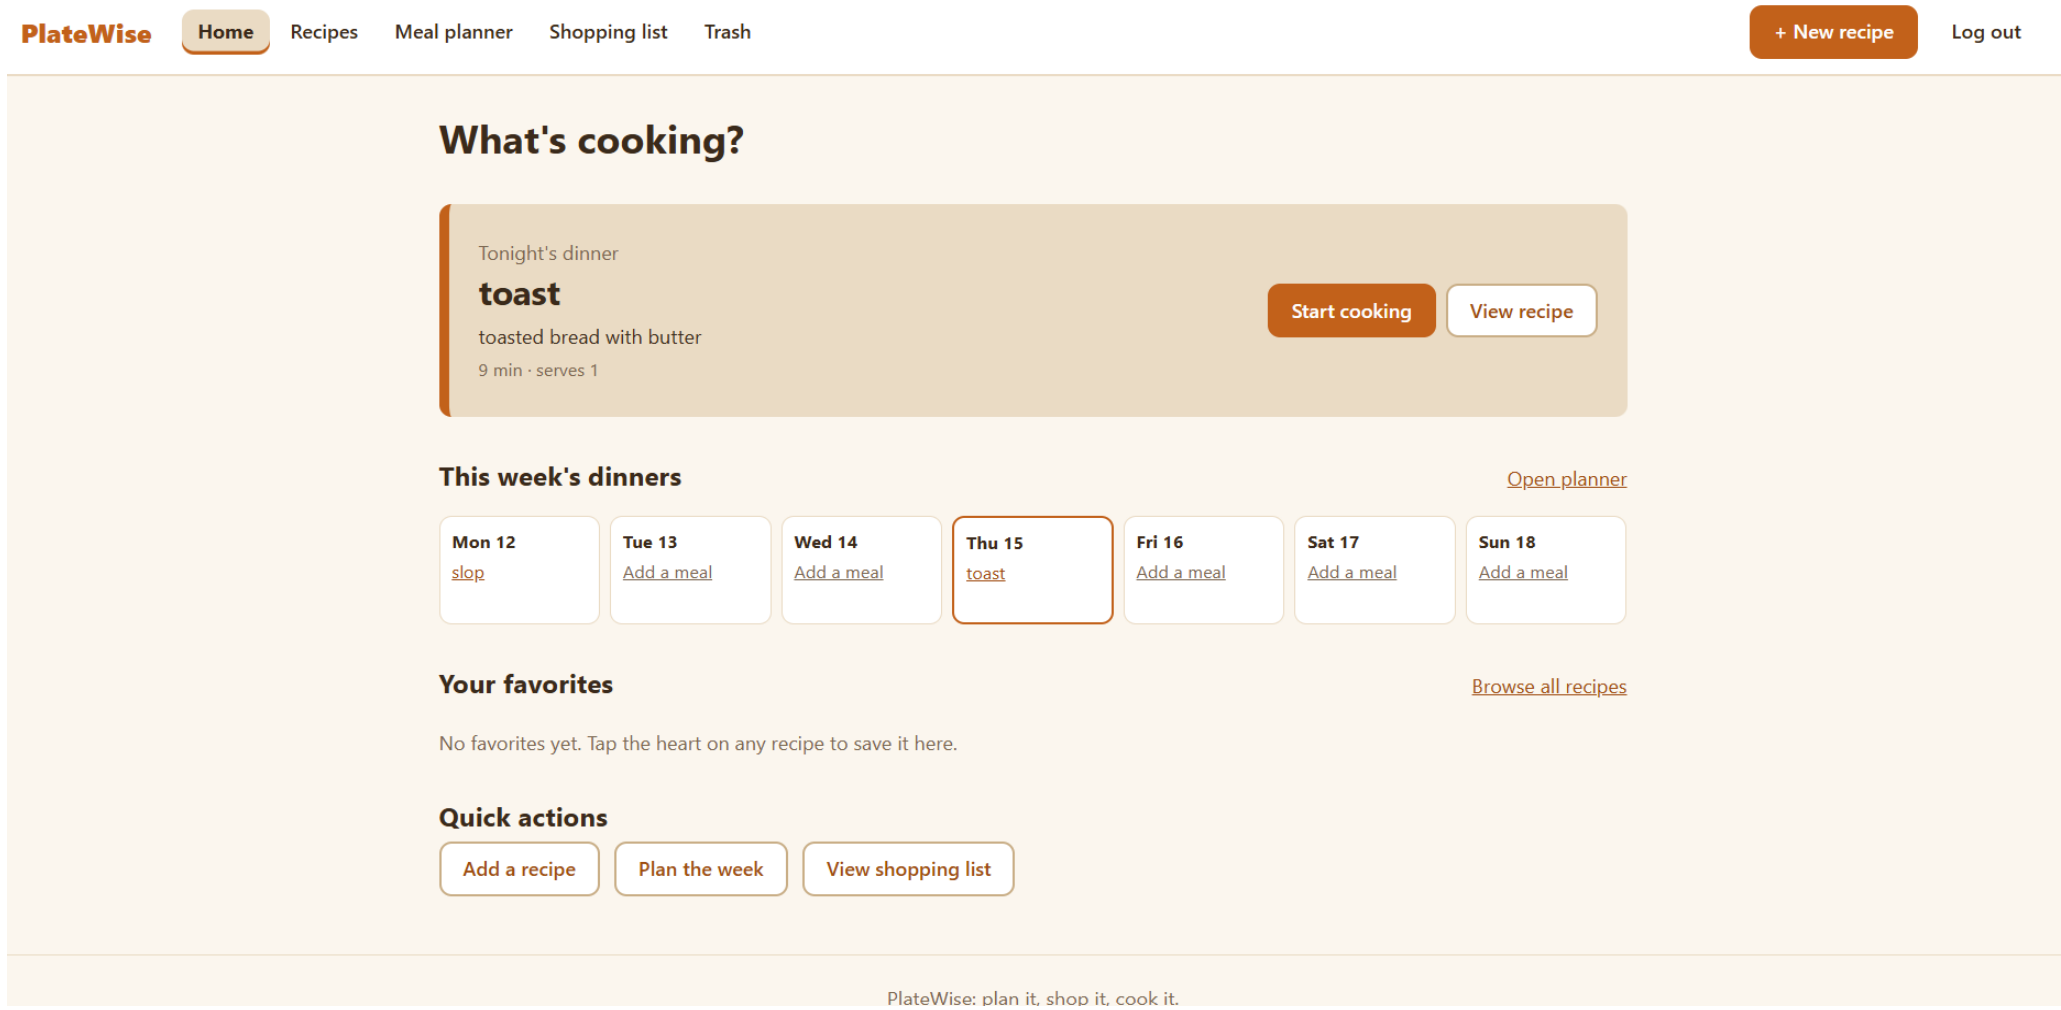

Login Screen

What it does – The purpose of the Login Screen is to allow new users to create an account, or to allow existing users to log into their previously created accounts.

Golden Rules – The primary golden rules that the login page satisfies is simple error handing, and informative feedback. This is best shown when a user has an incorrect login. There is a popup saying that the user's username or password is incorrect, and the application does not direct the user to the home screen as it would if the credentials were proper. The app handles the error of an incorrect login and gives informative feedback to the user by telling them that they didn't type in the right credentials. These golden rules are also shown through various other interactions in the login screen such as if a user tries to make a password that is too short, or tries to create a username that is already taken.

Home Screen

What it does – The home screen acts as the main hub for PlateWise and shows some useful data. This includes tonight's dinner, all dinners for the week, and the users favorited recipes, as well as a section at the bottom for quick actions.

Golden Rules – The primary golden rules the home page satisfies are strive for consistency and reduce short term memory load. The home page shows consistency because it’s the first page users get to after login and shows the style that the rest of the application follows. It also features the navbar that appears in every page of the application. It successfully reduces short term memory load by showing the user their weekly plan at a glance. Dinner for most people is the largest and most complicated meal of the day. The home screen displays today's dinner front and central and also allows the user to see the dinners for the week without having to navigate to their meal planner.

Add a recipe

What it does – Add a recipe tab allows the user to create recipes to save and reuse. This provides the user with an easier experience to select meals that are made often.

Golden Rules – The golden rules that are demonstrated with this page are Closure and Reversal. Closure is best demonstrated by the Move to Trash button. When deleting a recipe, the recipe gets moved into a trash folder which gives the user a clear sense that the action of deleting was completed while keeping the recipe recoverable. Easy Reversal is show by the Back to Recipes button which allows the user to leave the page at any time without committing to any change. It is also shown in the undo popup that allows the user to restore previously deleted recipes.

Recipes

What it does – The recipes tab allows the user to browse previously made recipes and quickly find something to cook within their filter and restrictions. They can search by recipe name, narrow results by category, show only their favorites, or add a new recipe. Each recipe card gives a quick preview that shows category, a short description, total time, and servings

Golden Rules – The golden rules that are presented are providing shortcuts and reducing short-term memory load. Shortcuts are best shown through the filter bar at the top of the page. Instead of scrolling and finding a certain recipe you are looking for, users can type part of the recipe name, pick a category, or check the "favorites only". Reduced short-term memory load is shown by the way the filters stay in place once they are applied. Because the selected search term, category, or favorites setting remains visible in the filter bar, users do not have to remember what filters they choose or which ones are shaping the results.

View recipe

What it does – The view recipe screen lets users view a saved recipe's times, servings, ingredients, instructions, and gives them options to return to their recipes list or move the recipe to the trash.

Golden Rules – The primary golden rules demonstrated are Closure and Consistency. Dialogue for closure is shown through the way the page is organized to be easy to read and act on. Recipes are divided into clear sections for times, ingredients, and numbered instructions that easily let the user know how far along in the process they are and when they are done. Consistency is shown through the red Move to Trash button, since red signals a risky action. It stands out from the tan Back to Recipes button and the orange buttons used elsewhere, so users understand the action carries more risk. This keeps the app predicable and consistent

Meal planner

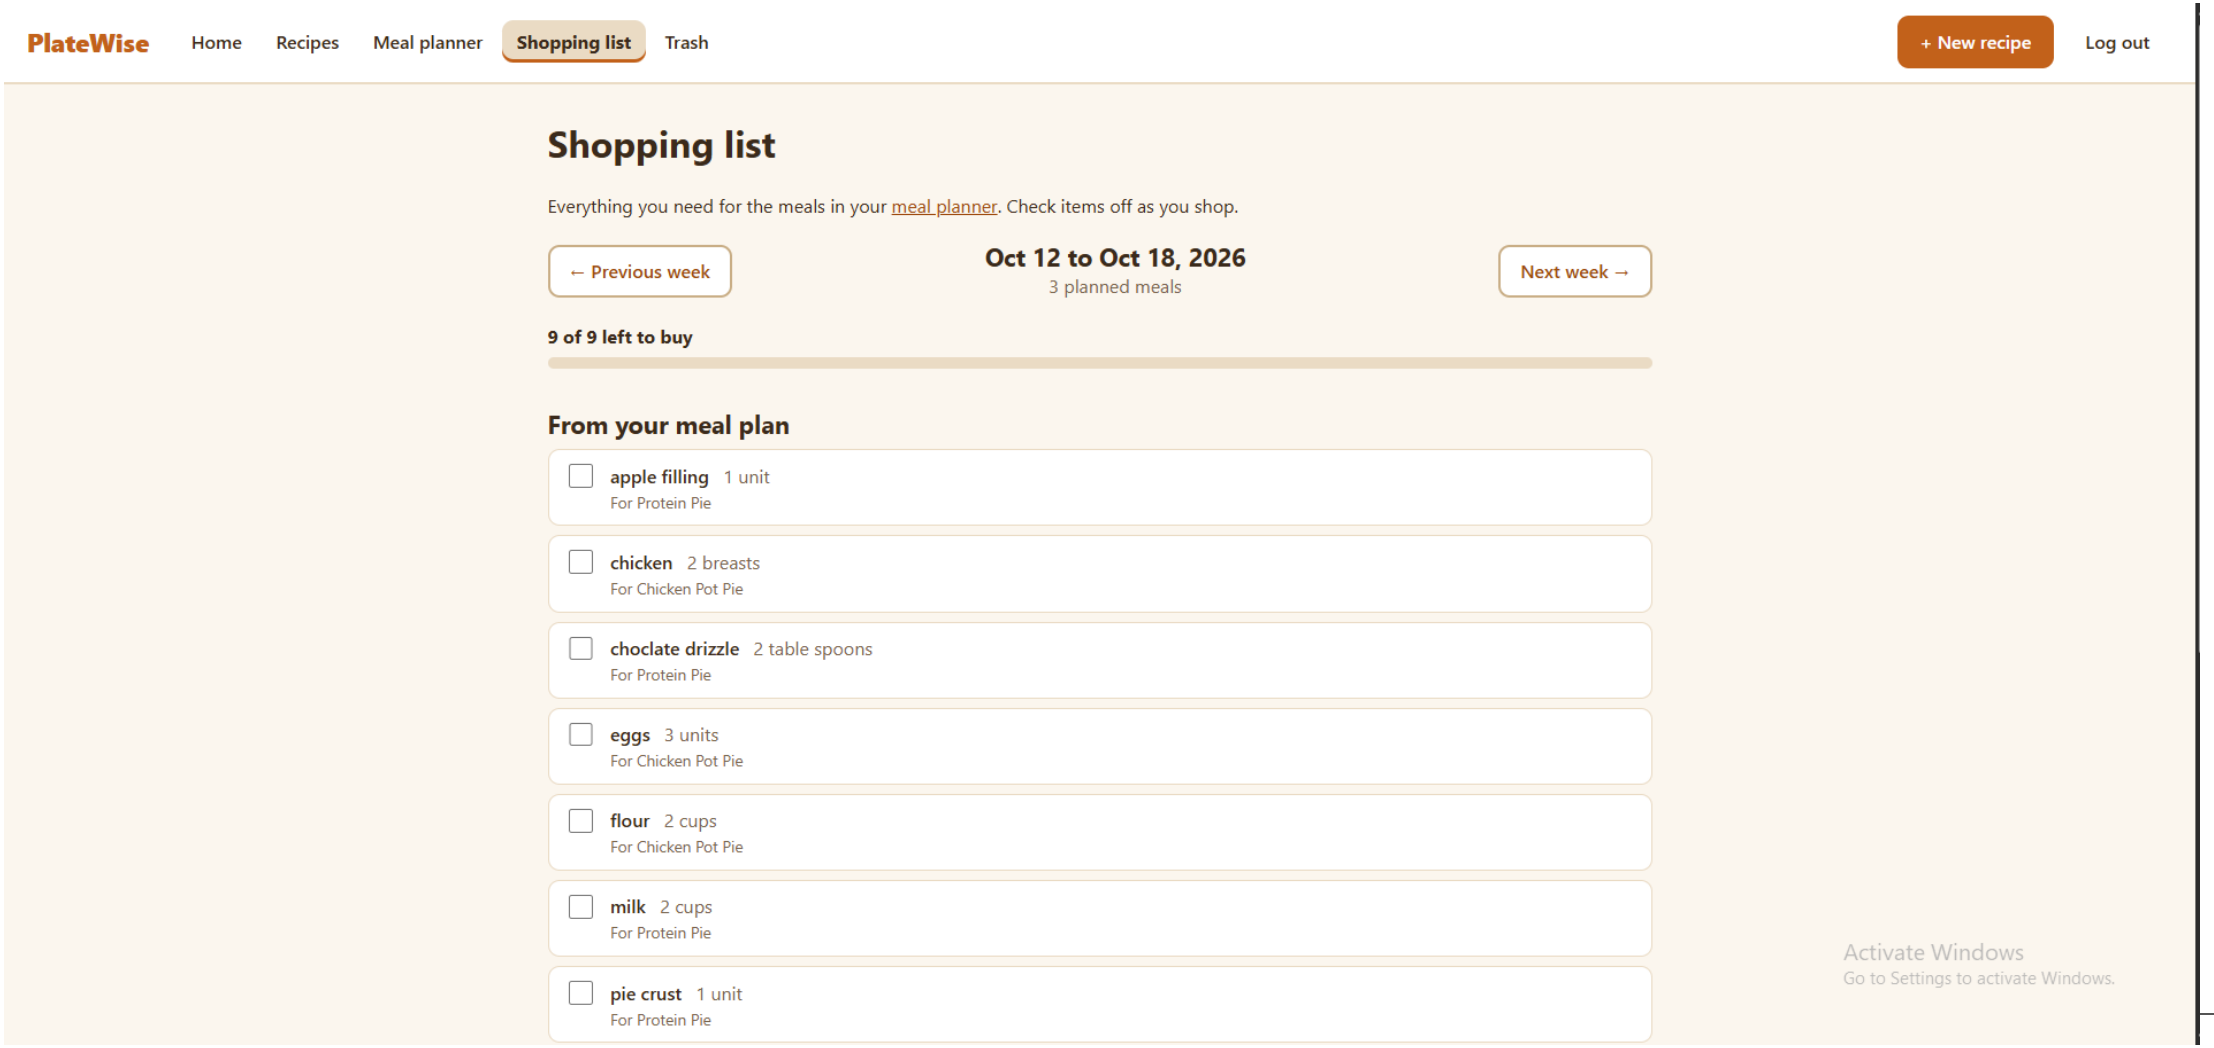

Meal planner

What it does – The Meal planner screen lets users plan their week by assigning saved recipes to breakfast, lunch, and dinner slots, and shows how many meals are planned. The shopping list is built from these choices.

Golden Rules – The primary golden rules demonstrated are shortcuts and simple error handling. Shortcuts are shown through the Copy last week's meals button, which allows the users to autofill their week in just one click instead of adding each meal for each day manually. This paired with the previous week and next week buttons allows for quick navigation for the users. Simple error handling is shown when a user tries to add a meal without choosing a recipe. The Choose a recipe dropdown is outlined in red to point out the problem, which prevents an empty meal from being saved and tells the users exactly what to fix. Also, the remove button allows for the users to quickly remove planned meals to correct mistakes.

Shopping list

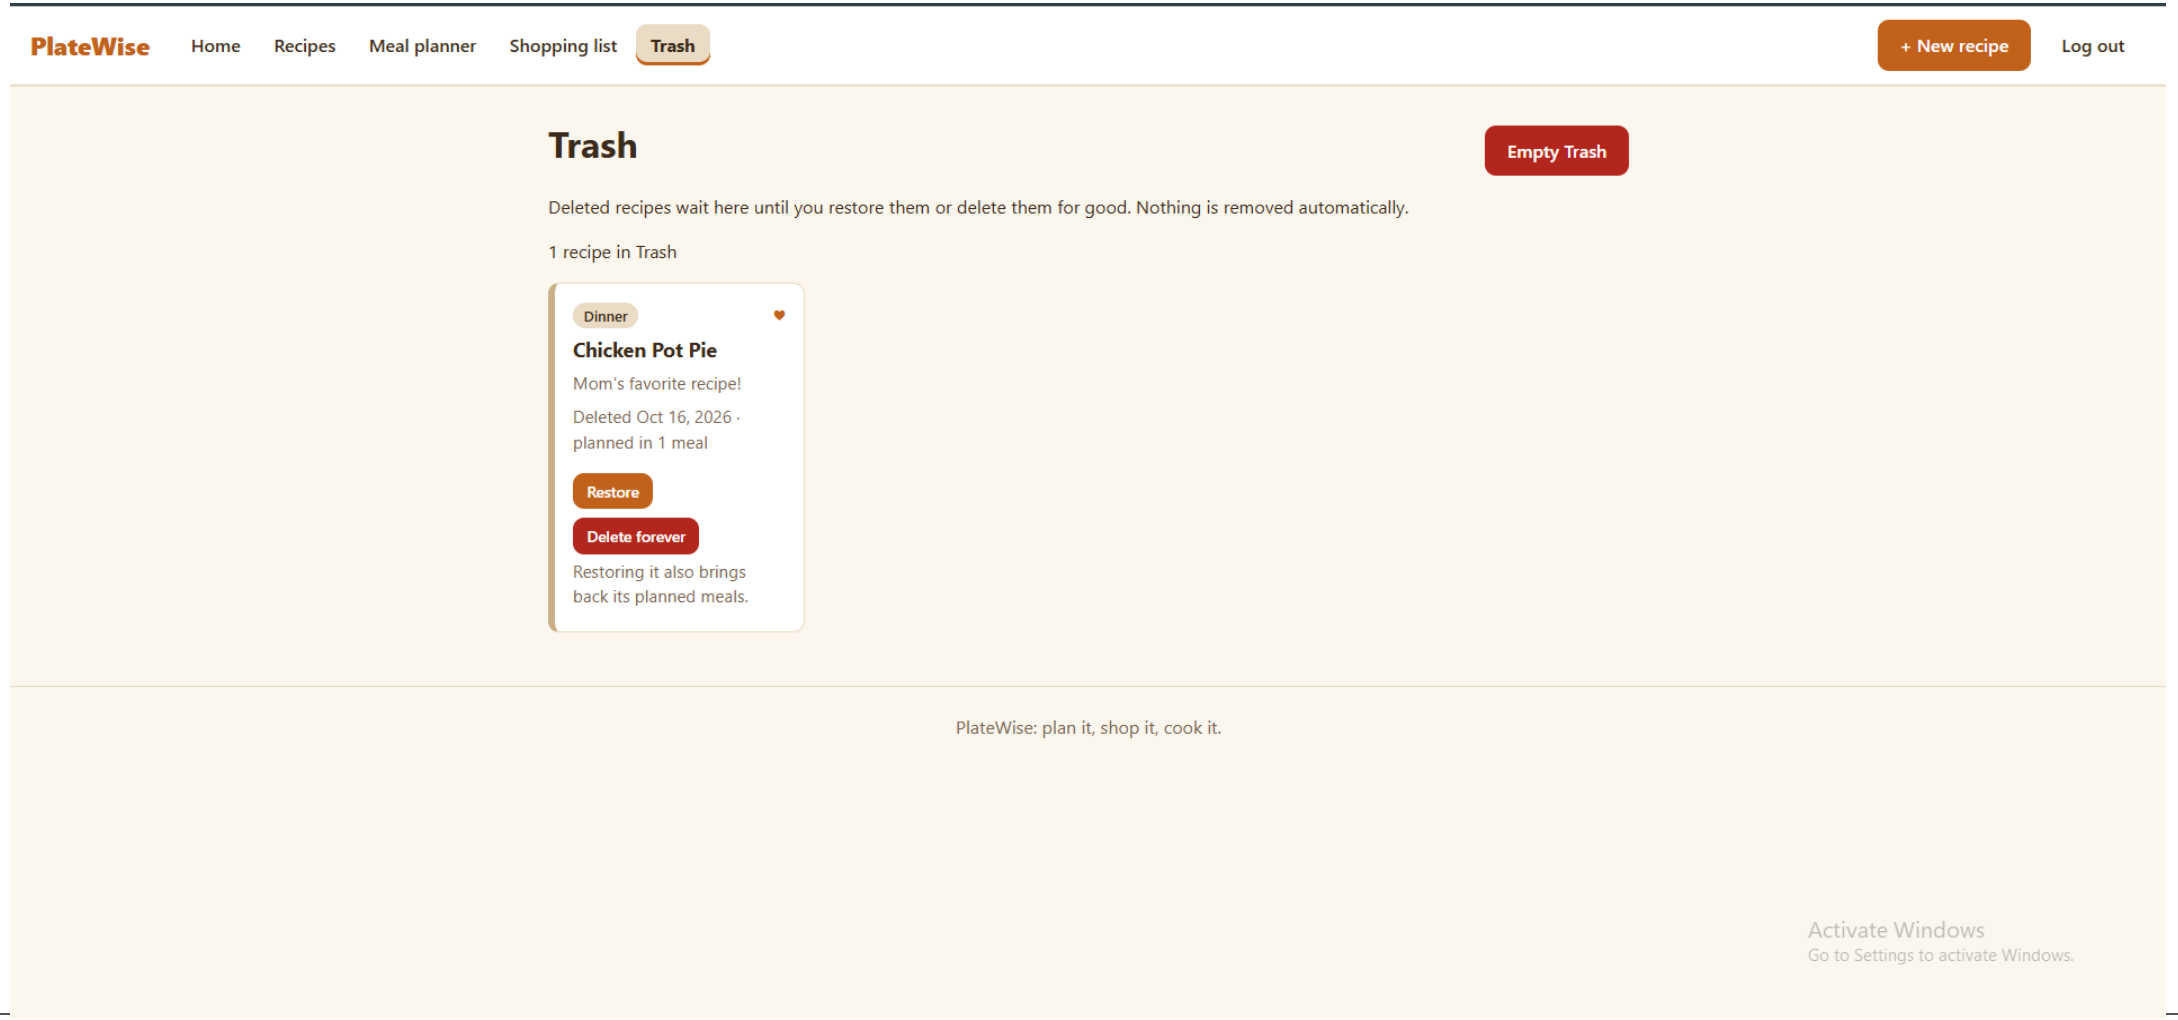

Shopping list

What it does – The Shopping list screen shows everything users need to buy for the meals in their planner, organized by week. Each item lists its quantity and which recipe it is for, and users can check items off as they shop.

Golden Rules – The primary golden rules demonstrated are informative feedback and user control. Informative feedback is shown through the checkboxes and the progress counter. When users check off an item, they can see right away which items are done, and the "9 of 9 left to buy" label and progress bar update to show how much shopping remains. This keeps users aware without needing to count items manually. User control is shown by the ability to add extra items that weren't generated from the meal plan, such as household staples or snacks. This lets users customize the list to fit their real shopping trip instead of being limited to what the app creates automatically.

Trash

What it does – The Trash screen holds recipes that users have deleted, showing when each was deleted and how many meals it was planned in. Users can restore a recipe, delete it permanently, or empty the whole trash.

Golden Rules – The primary golden rules demonstrated are easy reversal of actions, consistency, and informative feedback. Easy reversal is shown through the Restore button, which lets users pull a recipe out of the trash and return it to their recipe book. The note "Restoring it also brings back its planned meals" shows that the recipes full state is recovered, not just the recipe itself, and the page states that nothing is removed automatically, so mistakes are never final until the user chooses. Consistency is shown through the red buttons, since Delete forever and Empty Trash use the same red as Move to Trash on the recipe page. Red always signals a risky or permanent action, while the orange restore button looks like the safe, standard actions used throughout the app. Informative feedback is shown through the popups that appear after actions like restoring, deleting or emptying the trash, which confirm what just happened. The "1 recipe in Trash" count and the "Deleted Oct 16, 2026" date also keeps the users informed about what is stored here.
